

Studio Activity Guide 2: Human User Journey

Lecturer:	ASSOC.PROF.TS. DR. ROBIATUL A'DAWIAH BINTI JAMALUDDIN
Members:	JITU MOHTASIM BILLAH [253926445] HUSSAIN SHARIAR [253926112] PAUL NIRJON [253926372] AHAMED MOHAMMAD MOSTAKIM [253926139]

This guide has been pre-filled with the group's observations of the KLUST LMS (lms.iukl.edu.my), gathered while continuing from Studio Activity 1.

Task 1: Revisit Your Digital Product

Product	KLUST LMS (Kuala Lumpur University of Science and Technology Learning Management System)
Target User	A KLUST student trying to find, log into, and check the latest course/exam announcements on the LMS using their mobile phone.
Why is this user relevant?	Time-sensitive notices, exam slip releases, rescheduled exams, credit-transfer deadlines are posted directly to this system, and most students check it quickly between classes on a phone rather than at a desk, so this is the most common real-world way the product is actually used.

Task 2: Define ONE Critical User Journey

User Goal	Find and read the latest exam/course announcement on the LMS.
------------------	---

START	→	Search LMS on Google	→	Identify correct login link	→	Log in	→	Read announcements	→	GOAL
-------	---	----------------------	---	-----------------------------	---	--------	---	--------------------	---	------

Why is this journey critical?	It is the very first interaction a student has with the system, every single time, and it gates access to everything else exam slips, reschedules, credit-transfer notices. If a student cannot reliably find or log into the LMS, none of the time-critical information behind it matters.
--------------------------------------	---

Task 3: Observe a Real User

One group member acts as the test user and performs the journey naturally on their own phone while the rest of the group observes without guiding them.

Human Factor	Our Observation
Perception	Inconsistent colour and animation cues for sidebar icons and buttons made it unclear which elements were interactive versus purely decorative.
Attention	On a mobile screen, the user's attention was pulled toward layout elements that didn't resize properly (cramped menus, overlapping cards) instead of the announcement content itself.
Memory	The user had to remember that the login domain still uses the university's old name, "IUKL", even though the institution now presents itself as KLUST everywhere else.
Mental Model / Expectation	The user expected that searching the university's current name would lead straight to the login page; instead no clear, obvious result appeared, breaking that expectation.

Task 4: Record Authentic Evidence

Step	What Did the User Do?	What Did You Observe?	Human Factor	Evidence
1	Searched "KLUST LMS" on Google to find the login page.	No obvious, official top result for the university's current name came up the user had to scroll and guess which link was correct.	Mental Model	Observation notes
2	Identified and clicked the correct link, landing on lms.iukl.edu.my .	The domain uses "IUKL", the university's former name, not "KLUST" the user had to recall the old name to trust the link.	Memory	Screenshot
3	Logged in and opened the dashboard on a mobile phone.	Page elements did not resize cleanly for the smaller screen; menus and cards felt cramped.	Attention	Screenshot
4	Browsed the sidebar and status cards on the portal home.	Colour and animation choices for interactive elements were inconsistent, making it unclear at a glance what was clickable.	Perception	Observation notes

Evidence Screenshots

Task 5 Ask the User

1. Which part was easiest? Why?	"Once we found the right link, actually logging in was simple the form itself was easy to follow."
2. Which part was most difficult or confusing? Why?	"Figuring out that the site uses 'IUKL' instead of 'KLUST' was the confusing part I almost thought I had the wrong link."
3. If you could change one thing, what would you change?	"Make the mobile layout fit the screen properly, and update the branding so it matches the new university name."

Task 6 AI Visualisation: Human Experience Journey

Prompt 1: “Create a simple Human Experience Journey infographic for a KLUST student finding and logging into the KLUST LMS to check exam announcements on a mobile phone. Show these actual stages: search on Google → identify correct login link → log in → read announcements. Highlight the human factors we observed: perception (unclear colour/animation cues), attention (mobile layout not resizing), memory (domain still says IUKL, not KLUST), mental model (expected Google search to lead straight to login). Use short labels and do not add steps or findings that are not provided.”

Prompt 2: “I have attached the login page, home page and announcement page screenshots. Please do it accordingly”

Takeaways

Each member completes this individually before leaving class.

A possible target user for my assignment:	Student of KLUST.
ONE critical user journey I could investigate:	Searching for KLUST LMS in search engine.
One type of authentic evidence I could collect:	Screenshot of the login/dashboard experience.
One possible user source:	A KLUST student.

Lecturer Observation (Optional)

Participation	Journey Definition	Authentic Evidence	AI Visualisation
